Abstract (en)

[origin: EP0355489A1] A branched exhaust pipe of an internal-combustion engine (1) has two pipe branches (5, 6), which lead to a primary catalyst (4) and form a bypass to the latter, respectively. The corresponding division of the exhaust gas stream is effected with the aid of bimetal tongues (10a, 10b), which assume the respectively desired position as a function of the temperature of the exhaust gas stream. The primary catalyst (4) is thus only supplied while the exhaust pipe is still cold; overheating of the primary catalyst, which reaches its operating temperature rapidly at low mass flow, is thus excluded due to the automatic blocking of the pipe branch leading to the primary catalyst. <IMAGE>
