Abstract (en)
[origin: EP0355595A2] In a folding device having a collecting cylinder (1) which can be switched from collecting production to non-collecting production and is provided with grippers (7) and folding blades (5), and whose retaining members and folding blades are connected to actuating members preferably designed as sensor rollers (14, 15) and controllable by means of a respectively assigned control cam (12 and 13 respectively), whose control area, preferably designed as a control sink (16), can be selectively exposed and masked by means of a masking device provided with a masking cam (17) received on a drivable cam support (22) which is coaxial to the control cam (12 and 13 respectively), a high degree of variability in respect of the collecting operations that can be carried out is achieved in that the masking cam (17) of each masking device is accepted on the respectively assigned cam support (22) in a manner such as to be adjustable in the radial direction. <IMAGE>
