Abstract (en)

[origin: JPH0299644A] PURPOSE: To prevent the occurrence of yarn breakage by arranging a damping means comprising a force-storing means and a deflector between a weft storing device and a main nozzle, braking the yarn speed at the end of weft insertion and avoiding the occurrence of stress peaks. CONSTITUTION: A damping means 20 having a force-storing means 21 composed of a spring material in order to deflect a weft yarn 1 from a straight advancing path thereof is arranged before a main nozzle 7 in weft insertion of the weft yarn 1 drawn off from a package 4 and stored in a storing device 5 with the main nozzle 7. The damping means 20 engages the weft yarn 1 by cooperation with an upper deflector 23 in the near center of the two deflectors 22 and 23 arranged on both sides of the force-storing means 21. The measured yarn speed is used as a basis for controlling the period of start, duration and/or magnitude of the reduction of the deflection in the above deflection and/or the damping process to control the period of the start, duration and/or magnitude of the reduction of the deflection in the deflection and/or the damping process for performing the yarn speed braking. Thereby, stress peaks are prevented from occurring.
