Abstract (en)

[origin: EP0356552A1] In the edge replacement (23) of the sliding plate (5) of a sliding gate valve (3) which regulates the desired level (14) in a mould (9) from a throttling position (D1 or D2) to an opposite throttling position on the outflow channel (7), at least the throttling position (D1 or D2) to be taken up after an edge replacement (23) is dependent upon a discharge control preprogrammed in the processor (20) of the level regulator, in order to counteract relatively large variations in bath level in the mould (9). <IMAGE>
