Abstract (en)

[origin: EP0357514A1] The invention relates to a protective envelope for sub-munitions comprising means allowing it to be broken up, this being an operation necessary to ensure that, in the following phase, the ejection of the sub-munitions can be carried out without any difficulty in breaking up and ejection. <??>The breakable lines are obtained by means of wefts (2) of fibres resistant to high temperature and arranged in a plane perpendicular to the inner and outer surfaces of the envelope (1). The latter is a piece obtained, for example, by fusion and moulding, this weft (2) being incorporated so that, during the casting of the metal, the latter bonds to one another all the fibres forming the weft. <??>The invention is used on protective envelopes, especially for rockets and ammunition carriers. <IMAGE>
