Abstract (en)
[origin: EP0358059A1] The jointing device has a jointing block (13) which is arranged on a vibrating body (4). It is pivotable transversely relative to the axis of a toolholder which contains the tool to be machined. The jointing block (13) is also adjustable parallel to the axis of the toolholder. It is thus possible with the same jointing device to carry out either straight jointing or profiled jointing without any resetting or conversion. <IMAGE>
