Abstract (en)  
[origin: EP0359284A2] In an espagnolette, the driver is guided in the region of the cover rail and a housing is attached to the cover rail. A follower for moving the driver is mounted rotatably in the housing. This follower is prestressed into a middle position and can be pivoted out of the middle position in opposite directions of rotation. The follower acts on a control element which is guided parallel to the driver in the region of a narrow side of the housing remote from the driver. A follower return spring engages on this control element. A two-arm transmission lever extends from the control element to the driver and is mounted in the housing between the control element and the driver. Movement play is provided between the transmission lever and the control element. <IMAGE>
