Abstract (en)
[origin: EP0359687A2] The invention relates to devices for picking up spherical objects of differing dimensions and weights from the ground, without bending down. The device, forming the subject of the invention, is constituted by a solid or hollow shaft, made of one or more elements, carrying at its end two double grippers which are arranged symmetrically in relation to the shaft and the separations of which make it possible to pick up, on the one hand, playing balls and on the other, the ball known as the jack. <IMAGE>
