Abstract (en)
In a knitted fabric of the type comprising mesh courses bound with the meshes of adjacent courses, and mesh columns separated by intermediate channels, the channels of between the columns (c1,c3,c5,...) of a first knitted fabric are occupied by mesh columns (c2,c4,c6,...) of a second knitted fabric, the meshes (1a,1c,...-2b,2d,...) and the tackings (b1,b2) of both fabrics being bound with one another such that the ensemble forms a single fabric structure. The method consist in selecting a first series of needles distributed along a font such that they take yarn at a working set and are driven along a knitting cycle while the needles of at least another series are held out of work, and finally left to a height out of work, this cycle being repeated with a following needle series in a subsequent stage of the method. The obtained fabric is more resistant and regular.
