Abstract (en)

[origin: EP0359957A2] In a printing machine having at least one doctor blade inking device which delivers the ink to a screen roller, for simplifying a change of colour during production changeovers, the doctor blade inking device has an ink rail device with a support and an ink feed device with an ink pump, which are connected to each other via a hose. A fastening is provided both in front of and below the screen roller for the detachable connection to the printing machine of the ink rail device on the one hand and the ink feed device on the other hand. In this case, an output shaft with a coupling part is arranged on the fastening for the ink feed device while the ink feed device has a drive shaft for the pump ending in a counter coupling part. <IMAGE>
