Abstract (en)
[origin: EP0360456A2] A fluid dispenser according to this invention has a cradle (11) for holding a container (17) of liquid to be agitated before dispensing in a downwardly inclined position towards the dispensing outlet and means for causing a wave-like motion to the contents of the container. The means for providing the wave-like motion can be a rocking mechanism (25) for the end of the cradle remote from the dispensing end or means (23) for intermittently applying pressure to the wall of the container (17) adjacent the dispensing end. Means may also be included to compensate for the diminishing contents of the container.
