Abstract (en)

[origin: EP0360948A1] The object of this invention is a perfected machine, which, with continuous operating cycle, is suitable for the packaging in rolls of various strap-shaped materials by means of plurality of longitudinal cuts of a wide strip of material fed by a roller. The machine in question comprises at least one pair of spindles (20) supporting a plurality of cores (44) on which the above-mentioned strap-shaped materials, obtained by cutting a wide strip of material fed by a roller (12), will be wound. Once the rolls of material have been filled with the required quantity, the spindles are carried to a discharge station or unit (28), which cooperates with a supporting shaft on which the abovementioned discharge units carry the terminated rolls (22). The machine also comprises at least one pair of shafts to prearrange a new plurality of cores on the spindles for the start of a new packaging cycle.
