Abstract (en)  
[origin: EP0361118A1] The transport carriage (6) for cans has a turntable (16), on which the cans (26, 28) have predetermined set-down points which are all equally distant from the axis of rotation (15) of the turntable (16). The can-changing device (21) of the can transport carriage (6) has a specific can-unloading position and a specific can-unloading point (E) which is higher than the set-down points and which is at the same distance from the axis of rotation (15) of the turntable (16) as the set-down points of the cans. The can-changing device (21) has a switching device (17, 18) which further rotates the turntable (16) successively by the amount of one set-down division so that the set-down location of a particular can (26) is under the can-unloading point (E). <IMAGE>
