Abstract (en)

[origin: EP0361146A2] The invention relates to a joining beam for the fixing of frame constructions to one another or to adjoining walls. It is to be made possible that frame constructions such as e.g. window frames or frames of conservatory walls or roofs can, in all possible angular positions in relation to one another or to adjoining masonry, be connected continuously to one another or to the masonry. This is achieved by means of a cylindrical central piece (1), against which at least two independent angle pieces (2,3) bear tangentially with one leg (4,5) respectively, which can be or are fastened in the desired rotational position on the cylindrical central piece (1) by means of this adjacent leg (4,5). <IMAGE>
