Abstract (en)
[origin: EP0362749A1] Window or door frame (10), with a glass pane, in particular an insulating-glass pane (11), inserted therein, or with a panel inserted therein, which is supported on the frame (10) via a block (12) which is held by an angular holder (13) at a given distance of a front edge from the frame top (14). In order to develop a frame (10) of the type mentioned in the introduction in such a manner that its block (12) can be arranged directly in the space between the frame (10) and the pane (11) or the panel at the correct distance from the frame top (14), in particular in a constructionally simple design for a single block (12), it is designed in such a manner that the holder (13, 13") is in one piece with the block (12), has a width (b) which can alternatively be less than the block width (B) and is arranged to be flush directly with a longitudinal edge (15) of the block or at a distance (c) from this edge (15), which is predetermined by the relative position between frame side surface (16) and pane (11) or panel.
