Abstract (en)  
[origin: EP0362833A2] The wood-working machine has spindles which carry wood-working tools. The wood to be worked is transported through the machine by a feed unit. The machine has supports (32, 35) which are adjustable transversely to the transport direction (31) of the wood and carry two wood-working tools (1, 2, 3, 4). They can be alternatively shifted with the respective support into a working and a rest position. As long as one wood-working tool is in the working position, work necessary at the other wood-working tool located in the rest position can be carried out without the wood-working machine having to be stopped or the passage of the wood through the machine having to be interrupted. <IMAGE>
