Abstract (en)
[origin: EP0363754A1] An automatic toilet water-tank (7) with a lateral opening and an opening on the upper end (25) can be developed so that the concentrated active ingredient is only released when the flushing means is discharged; to this end, a float (9) is provided on the upper part (6) of the container (2), opposite the solid cleaning agent (4), thus enabling the entire apparatus to float freely, the outlet of the lateral opening (1) always staying below the surface of the water (8); the lateral opening (1) is so designed that the concentrated active ingredient cannot flow out when the water tank is full.
