Abstract (en)
[origin: WO8810339A1] A tile of rubber or the like has hollow cylindrical projections (5) extending from the underside of a sheet (4) and adapted to buckle to cushion impacts against the upper surface of the tile. The tiles, and edge strips (2) which are laid around the tiled area to define a smooth transition between the surfaces of the tiles and the surrounding ground surface, are fixed to the ground by fixing members (15) which tightly embrace the projections on the underside of the tiles and edge strips.
