Abstract (en)  
[origin: EP0296557A2] Contaminating vector sequences are removed from recombinant cloned DNA or RNA using capture beads to which is covalently attached capture vector sequences which are complementary to the contaminating sequences. Alternatively, the capture vector sequences are covalently attached to one member of a specific binding pair and the capture beads are attached to the other member of the pair. The method is generally applicable to removal of contaminating DNA or RNA sequences from recombinant, cloned DNA or RNA.
