Abstract (en)

[origin: EP0365812A1] In the manufacture of (film) packagings, in particular for stacks of paper handkerchieves, blanks are separated from a continuously fed material strip and fed to a folding device, in particular a folding turret (11) for the wrapping of the paper handkerchieves and the folding of the blank (10). <??>In the event of the momentary interruption of the supply of articles to be wrapped to the folding turret (11), the manufacture and forwarding of blanks (10) is also to be interrupted. To this end, a stationary counter-cutter (22) of a separating station (16) can be temporarily moved out of working or cutting position, so that, despite continued running of cutter roller (21) with cutters (23, 24), a separating cut is not made in the stationary material strip (12). For this purpose, a support for the counter-cutter (22) is equipped with a pulsed adjusting gear. <??>By means of the arrangement and operation of the cutters, in particular by means of the movement of the counter-cutter for the interruption of the manufacture of blanks, extremely fast and accurate operational runs are possible. <IMAGE>
