Abstract (en)

A non-refillable pourer fitment which fits within the neck of a container comprises outer and inner parts (4,2) captively attached together, and a non-return valve member (6) which permits the contents of the container to be poured out through the fitment but prevents flow into the container. The outer part (4) is provided at or adjacent its outer end with an outwardly-directed annular flange (36) which overlies the rim of the container to which it is applied, a flexible outwardly-directed annular fin (38) being adapted, on application of the fitment to the neck of the container, to be squeezed between the rim of the container and the annular flange (36).
