Abstract (en)

[origin: WO8905189A1] A multi-component adhesive system is provided wherein the components are stored in containers (80), (82), each having an orifice (88) at one end and a slidable plunger (92) at the other. The containers (80), (82) holding identical components are arranged diagonally to each other on opposite sides of a common axis. A force is applied simultaneously against each of the slidable plungers (92) to push the components from each container through each orifice (88). The components are mixed directly as they are pushed from the container to be extruded to said work site.
