Abstract (en)

[origin: EP0369221A2] In an electrical switch (1) for an electrical hand-held tool comprising an operating element (7), which can be pivoted against the force of a first restoring spring (16), for a switching mechanism (2) comprising a switching-off and a switching-on lock, a particularly rugged and accurate operation for the roughest professional use is achieved by the fact that the operating element (7) is supported rotatably around a second shaft in the form of a shaft bolt (10), which is supported at the housing (12) rotatable at least around a first shaft in the form of a shaft bolt (13), at a distance to this first shaft, and that the switching-on lock and the switching-off lock are a one-piece component of a guide body (19) which is arranged fixed to the housing and in which the guided member is a cylindrical guide bolt (11). <IMAGE>
