Abstract (en)
[origin: EP0369261A1] A hinge with a hinge arm (1) which is connected to a hinge pot via articulated levers or the like and which is mounted on a baseplate (3) by means of a gap-adjusting screw (4), a depth-adjusting screw (5) and an intermediate piece (2). The intermediate piece (2), at its end near the axis of rotation of the hinge, can be suspended in the baseplate (3) by means of a rigid hook (8) and is rotatable about this bearing point. At its opposite end, it has a resilient hook (9) which engages with the baseplate (3) and which retains the intermediate piece (2) on the latter. The baseplate (3) has a U-shaped cross-section in the region of the intermediate piece (2). The hooks (8, 9) of the intermediate piece (2) engage on the middle web (20) of the U-shaped profile of the baseplate (3). <IMAGE>
