Abstract (en)

[origin: EP0369319A2] Tables with a top (7) which is mounted movably on the table frame and is adjustable have proved to be useful for many purposes. However, the adjusting devices used previously in such tables are either very complicated or difficult to handle. <??>An adjustment device which is of very simple construction and is easy to handle is provided by the fact that at least one abutment (5) is attached fixedly below the table top (7) on the table frame and the abutment (5) is assigned a wedge-shaped intermediate piece (9) which is mounted displaceably in the direction of opening of its wedge angle essentially parallel to the table top (7) and can be inserted to a greater or lesser extent between the abutment (5) and the table top (7) so that the position of the intermediate piece (9) determines the distance of the table top from the abutment and thus also the position of the table top relative to the table frame. <IMAGE>
