Abstract (en)
[origin: WO8910880A1] In a single-use container (10) for mixing and dispensing two components contained therein and having an internal membrane (20) which divides the container into two chambers (30, 31) in which the separated components are located, the membrane (20) must be mounted on a flange which projects beyond the wall of the container (10). The flange is unsightly and increases the volume and hence the cost of the surrounding wrapping. This drawback is avoided in a container (10) designed as a pressure pack with dispensing valve (12), in which the membrane (20) is sealingly fastened to the interior of the container (10) and is designed so that the membrane (20) is opened by a force generated by a pressure differential induced between the chambers (30, 31).
