Abstract (en)
[origin: EP0370121A1] A dispensing mechanism for a retrieval system having a driven toothed conveyor belt (4) is proposed, the driven toothed wheel of which is considerably larger than the other conveyor belt deflection roller or rail (7), an angle of contact for the conveyor belt of preferably about 270 DEG in the case of the driven toothed wheel (6) being set. The continuously driven toothed wheel is divided into two and possesses a magnetic coupling in a compact structure. The compact structure of the dispensing mechanism which can be used economically in many ways is of particular advantage. <IMAGE>
