Abstract (en)

[origin: EP0370875A1] Laundry dryer equipped with an automatic operating control system, characterised in that the automatic operating control system comprises at least one means triggering the end of a drying cycle when the rate of variation of the outlet air temperature per unit time ($\Delta T/t$), calculated from a measured outlet-air temperature (T) at least higher than a corresponding experimentally predetermined minimum outlet-air temperature (T_m), is higher, for a predetermined validation time (t_v), than a corresponding experimentally predetermined minimum rate (a./t) of variation of the outlet air-temperature at the end of the drying cycle per unit time. <IMAGE>
