Abstract (en)

[origin: WO8910881A1] Pressurized container (1) provided with a lock device (6) for locking the push-button (54) situated between the valve actuation device (5) and the cap (31) wherein the valve (4) is arranged. Such device is comprised of a channel (64) which is appropriately inclined wherein circulates under the effect of gravity a moving member (63) which locks the push-button when it is situated at the extremity (64a) of the channel situated on the valve side. The locking device allows to prevent the use of the pressurized container when it is in an undesired position, head up or head down.
