Abstract (en)

[origin: WO8906300A1] The system disclosed, which ensures the passage from a first region, in which the carriages are close together, to a second region in which the carriages are separated, and vice versa, is characterized in that it comprises: at least two carriages (6,6') connected by a flexible or collapsible linking element (26); dogs (15) which drive the carriages via an element which can be retracted for storage, and which are arranged on a driving chain (13) at predetermined intervals. The invention also concerns an application to an installation for storing and positioning seats and the process for implementing it.
