Abstract (en)
[origin: EP0375089A1] The invention relates to a support piece for the transoms of a carton wall structure consisting of hollow sections (13, 10) having a stop surface on the post side, a mating part (2) being provided here which has a support element and at least two push-in pins (7, 7') firmly anchored to the mating part (2). In order to permit in particular the cost-effective manufacture of the support piece for the transoms, it is proposed that the support element be designed as an elongated guide rail (3) whose end area has tapped holes which project beyond the mating part (2), and that the locking of the support piece for the transoms to the post (13) be effected by a securing element (23) which leads through the tapped hole in the guide rail and, with its conical end (24), engages into the groove (25) of the post (13), the transom (16) being secured in place at a predetermined distance from the post wall by means of a screw (27). <IMAGE>
