Abstract (en)
[origin: EP0375277A2] A curtain wall system for the cladding of a building which comprises framework members (12,14) for receiving and seating infill panels (22,24), and gaskets (30) adapted to be received within the framework members to extend over and retain the infills (22,24), characterised in that, for a given infill, one or more clips (34) are provided which locate in respective channels (36,38) in orthogonally disposed adjacent framework members (12,14) and retain the corner of the infill (22,24). The clips (34) give added mechanical retention for exceptional loading but do not detract from the flexibility of the system.
