Abstract (en)
[origin: EP0378869A1] Rolled nonferrous sheets for covering a roof and for cladding a wall can be laid, starting at the eaves, on an underlying structure by means of cleats locked into the seam and can be connected to one another by cross weltd seams extending at their sides. In order to achieve an improvement in the structural performance while keeping the wind load as low as possible, the nonferrous sheets have a rhombic or square shape and the cross weltd seams are attached, on the side remote from the building, in the upper sheet half (6) and, on the building side, in the lower sheet half (8). <IMAGE>
