Abstract (en)
[origin: EP0379362A2] A display device comprising a sheet form support member 11 having a lower portion with two base edges 32x, 32y extending from a vertical fold line 14 to enable such member to be folded with the first base edge 32x and an adjacent first lower area 13x overlapping the other, second, base edge 32y and adjacent second lower area 13y. The first and second lower areas 13x, 13y have thereabove respective first and second intermediate areas 30x, 30y bounded at their lowermost extents by respective second fold lines 16 formed therein at acute angles to, and in the same direction as, the vertical fold line 14 and being bounded at their uppermost extents by respective third fold lines 19A formed therein at acute angles to, and in the opposite direction to, the vertical fold line 14 formed in the lower portion. The vertical fold line 18A between the first 30x and second 30y intermediate areas is in the opposite direction to vertical fold line 14. Respective first and second upper areas 31x, 31y are bounded at their lowermost extents by the third fold lines 19A being separated by a vertical fold line 22B therebetween which is in the same direction as that dividing the lower portion.
