Abstract (en)
[origin: EP0380059A2] To form a corner locking device for a window, a locking slide is mounted on a casement leg so as to be displaceable in its longitudinal direction and can be shifted into a locking recess of the particular frame corner region, the locking slide being prestressed by springing with the effect of disengaging it from the locking receptacle and being shiftable into the locking recess as a result of a relative movement of the casement in relation to the frame. <IMAGE>
