Abstract (en)  
[origin: EP0380087A1] The invention relates to a device (1, 1') for washing the hair from behind, having a wash basin (3, 3') which is supported by a standing column (5, 5'), a washing tap fitting (6, 6') being arranged near to the edge (4, 4') of the basin. In order to achieve optimum handling of the washing tap fitting (6, 6') independently of a seated position of a hairdresser's customer and independently of an individual working position of a hairdresser, it is proposed by a first solution according to the invention to connect the support arm (8) of the washing tap fitting (6) to the column (5) via a hinge (9). In a second solution according to the invention, it is proposed to provide a guide rail (23) to displace the fitting (6') along the upper edge (4) of the basin. <IMAGE>
