Abstract (en)
A building flashing (1) for use for example for finishing work at building corners, head joins, eaves and ridges comprises a metal sheeting deformed to provide a plurality of wall portions (2a - 2d) set at selected angles to each other dependent on the specific function of the flashing, certain of said wall portions (2a - 2d) serving to facilitate joining of the flashing to a component of a building. At least one of wall portion (2a - 2d) of the sheeting is embossed (E) and this embossement serves to increase the structural strength of the flashing and can also improve the aesthetic quality of the flashing.
