Abstract (en)

Crystalline aluminophosphates and related compounds having in the as-synthesized anhydrous form the chemical composition: $mR(XnAlqPx)02$, wherein R represents ethylenediamine, X represents one or more elements which can be substituted for Al and/or P, wherein $m=0.01-0.33$ $n=0-0.50$ $q=0.30-0.60$ $x=0.30-0.60$ and wherein $n+q+x=1$, and having an X-ray diffraction pattern containing at least the following lines:
<IMAGE> The compounds can be prepared from a forming solution or gel comprising a source of aluminium, a source of phosphorus, a source of ethylenediamine and optionally a source of at least one component X, which mixture is kept at elevated temperature for a period of time sufficient to produce a crystalline aluminophosphate or related compound followed by separating off the crystalline product obtained and drying, and which may subsequently be calcined.
