Abstract (en)  
[origin: EP0380980A1] The housing (112) of the vacuum switch has, in the upper connecting region (110), a passage (122) through which the connecting element (144) is guided. The latter engages with its end region (144') into a recess (138), located opposite the passage (122), in the housing (112). The connecting element (144) is supported in the region of the passage (122) on the supporting tongue (124) and is firmly clamped by means of the wedge-shaped retaining member (146). The vacuum switching chamber (114) is screwed onto the connecting element (144). The connecting element can also be mounted on the housing (112) close to the supporting point (136) located opposite the passage (122). <IMAGE>
