Abstract (en)  
The under-mattress (1) is provided with hollow sections (4, 5) between which a network (14) is stretched. The hollow sections (4, 5) are a special shape, thereby producing the maximum width of network (14). This shape is determined by a polygon, having a face (9) which runs inwards and downwards from the top outside edge (10) of the section (4, 5) and the top edge of which is directly below the network (14), a face (15) which connects to said face (9) at an angle and which runs downwards and/or outwards, and the width of which corresponds to the height of transverse reinforcements (6) which can be connected thereto, and at least a further face which closes the section cross-section. In an under-mattress (1) with flap-up head end (2) and/or foot end (3) provision is also made for a fixed section (7) which has a wall part (8) parallel to the face (9) of section (4).
