Abstract (en)
[origin: WO8903211A1] Cocaine addiction is treated by administration of an endorphinase or enkephalinase inhibitor, and optionally, a dopamine precursor, or a serotonin precursor, a GABA precursor, or an endorphin or enkephalin releaser. These components promote restoration of normal neurotransmitter function and are non-addictive. Use of the dopamine precursors L-phenylalanine or L-tyrosine, the enkephalinase inhibitor D-phenylalanine and/or the serotonin precursor L-tryptophan is especially preferred.
