Abstract (en)

[origin: EP0382085A1] The device is used for cleaning the walls of houses, the sides of ships, industrial buildings or the like and has spraying nozzles (1) to which pressure water is admitted and which are rotatably mounted and can be driven about an axis (3) of rotation. With the spray nozzle or spray nozzles, a bucket wheel rotatable about the same axis of rotation forms a construction unit to which a chamber open in the spraying direction of the nozzle is allocated. A discharge channel for the contaminated washing water is formed by a spiral shape of the chamber. The device is intended to simplify the separation of the paint particles and the other solids contaminating the washing water from the washing water and the disposal of the separated paint particles and the solids. In the cleaning device, the discharge channel (22) merges into a connection piece (23) to which a collecting sack (24) is fastened which receives the paint particles contained in the washing water and other solids and is made of a material permeable to water. <IMAGE>
