Abstract (en)
[origin: EP0382176A2] The invention relates to a steam bath module with individual self-supporting wall, ceiling and floor sections which are connected in a steam-tight manner and are made from steam-resistant material, to receive one or more seat assemblies. In order to prevent the undesired dripping of water of condensation from the roof, provision is made for the ceiling section to comprise two oblique ceiling surfaces intersecting at a ridge line, which form an uninterrupted interior defining surface following the contour of a double-pitch roof, on which a run-off surface for the water of condensation is provided. <IMAGE>
