Abstract (en)
A mounting frame (10) for use with a tractor loader is disclosed wherein the main support arms (12) extend generally linearly from the rear pivot mountings (14) thereof with the tractor (T) to the front pivot mountings (16) with the loader bucket (25). The thickest portion (18) of each main support arm (12) is positioned immediately rearwardly of the transverse torque tube (20) interconnecting the laterally spaced main support arms (12). Each main support arm (12) decreases in size from this intermediate portion (18) toward the forward and rearward pivots (16, 14). Each main support arm (12) is generally symmetrical about a straight line interconnecting the forward and rearward pivots (16, 14).
