Abstract (en)
Improvements to electrical connections are described, consisting of a connector whose cross-section is shaped like the Greek letter omega and which is particularly suitable for connecting two bodies with a round or polygonal cross-section, as well as an electrical terminal in flexible conducting material, constituted on one side by a flexible lamellar terminal and a flexible contact on the other, in which the part conformed as a flexible terminal serves as an anchoring point to a round or polygonal cross-section conductor, while the part conformed as a flexible contact serves to grip the metal pin of a two-pin bulb. The flexible contact has two holes in opposed positions, through which one of the two metal pins of the bulb is inserted. Thus this invention is constituted by the combination of the two principal parts, combined together into a single continuous body which is a conductor of electricity.
