Abstract (en)
[origin: EP0383003A2] There is proposed a fixing device 16 for the wings of windows, doors or the like, the opening width of which can be limited by an arm 6a articulated pivotably on the frame on the one hand and on the wing on the other hand, on the arm 6a engaging by means of a journal 14 or the like into a longitudinal guide 11 which, at its end assigned to the opening position of the wing, has a limit stop 15 for the journal 14 or the like. Connected to the journal 14 or the like is a drag plate 17 which is held so as to be longitudinally displaceable relative to the longitudinal guide 11 and which carries a catch projection, to which an elastically deflectable locking boss is assigned fixedly adjacent to the longitudinal guide 11. A carrier 18 having the locking boss passes through a longitudinal slot or cutout 21 in the drag plate 17 and is anchored to the longitudinal guide 11 by means of a screw 22. A subsequent fitting and removal of the fixing device 16 is possible. <IMAGE>
