Abstract (en)  
[origin: EP0383149A2] In a folding apparatus having two production lines (1, 2), each having a transverse-folding device (3, 4) and a belt guide (5, 9; 6, 10) departing from this and of which at least one is provided with a longitudinal-folding device (7, 8) running through from the associated belt guide and intended for the production of a second longitudinal fold, a high user friendliness and production accuracy is achieved if the two production lines are connected to one another in the region between the transverse-folding devices (3, 4) and the longitudinal-folding device (7, 8) by means of at least one belt-guide branch (17) which bridges the gap between them, is assigned a deflecting roller (18, 19) on the inlet and outlet side respectively and is held with the deflecting rollers (18, 19) on a rocker arm (24) which can be pivoted about an axis (27) parallel to the deflecting rollers. <IMAGE>
