Abstract (en)
[origin: EP0383235A1] The packaging container made of plastic has a beaker body (1) which has a filling opening and whose shell surface has an essentially rotationally symmetrical, tapering shape in a region originating from the filling opening. The filling opening can be closed by a lid element (6) which is situated in the position of use of the container on the bottom of the latter. An outlet device is situated on a removal side facing away from the bottom side. The beaker body (1) has recesses (3) on both sides of a longitudinal centre plane (E). Provided on the removal side is an elongate end region (8), in which there is at least one opening (11 or 12) which is surrounded by a resting surface (13 or 14) and is tightly covered by a detachably fixed closure member (10). <IMAGE>
