Abstract (en)
A connector is described for connecting two or more beams together having at least two surfaces each of which is engagable by an end plate of a beam and wherein at least one said surface has wedge clamping means associated therewith. In a preferred embodiment the connector is a six-way soldier connector having opposed upper and lower bolting surfaces 10, 12 and four side wedge clamping surfaces 18. Each surface 18 is provided on a vertical spacer 16 and includes upper and lower pairs of limbs 20-22 and 24-26 with abutments 28 defining a space between each abutment and a surface 18 for receiving a wedge 30. When inserted, the wedge 30 effects pressure clamping engagement of the end plate of each horizontal soldier to the surface 18.
