Abstract (en)

[origin: EP0383661A1] Electrical connection device comprising a conductive part (28) possessing an end (30) for receiving an electrical cable (10) and an end (32) suitable for a connection to a terminal (16), this connection end being constituted by a split ring which is elastically deformable, of a shape adapted to that of the terminal and disposed in the axial continuation of the cable, the device furthermore comprising an insulating rigid sleeve (46) suitable for axially sliding over the cable (10) and the conductive part (28) between a first position removed from the ring for its installation on the terminal or its extraction from the terminal and a second position engaged on the ring for the clamping of the ring onto the terminal, which renders it virtually impossible to pull out from the terminal. <IMAGE>
